# Supplementary Specification

## 1. Introduction

The Supplementary Specification captures the system requirements that are not readily captured in the use cases of the use-case model. Such requirements include:

- Legal and regulatory requirements, including application standards.
- Quality attributes of the system to be built, including usability, reliability, performance, and supportability requirements.
- Other requirements such as operating systems and environments, compatibility requirements, and design constraints.

## 2. Non-functional Requirements

### 2.1 Availability

The system is not expected to be used in urgent scenarios so we can afford a SLA<sup>1</sup> of 99.5%. This translates into a yearly downtime of roughly 1 day and 19 hours, or a monthly downtime of 3 hours and 39 minutes. This time can be used to perform software updates, data compression and garbage collection.

### 2.2 Performance

Performance is not a key factor for our system. For this reason we can allow a response time of up to 30 seconds for service submissions/book requests in the worst case scenario. The average response time, depending on the load of the system, should be 1 second.

### 2.3 Security

The system will be secured using https encrypted connections. Also we will demand user authentication and will not keep passwords in plain text. All the user data and sensible information will be encrypted so it will not be vulnerable.

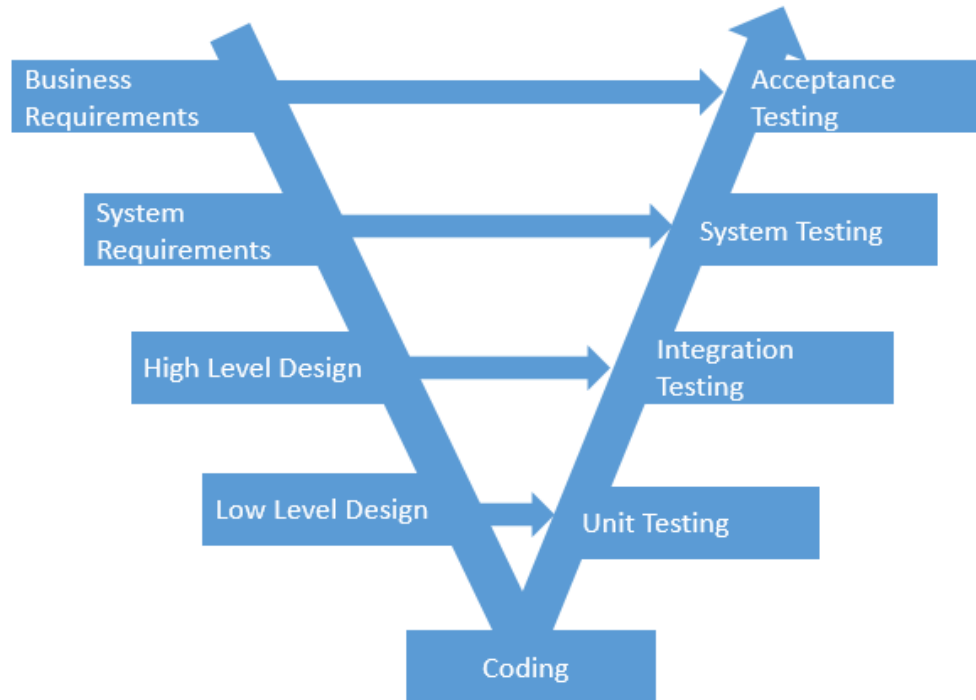

### 2.4 Testability

The business logic of the application must be tested independently from the user interface. We will employ V-Model testing as illustrated in Figure 1 V-Model Testing. We aim to have over 90% test coverage, through unit and integration tests. With respect to manual testing, the system will log all information that is not displayed in the user interface, so that the system is fully observable and testable.

---

<sup>1</sup> SLA = Service Level Agreement = Availability

Wedding App Planner	Version: 1.0

### **2.5 Usability**

The user should be able to reach any desired goal in under 30 mouse clicks. Also, since the service provider works under stress, the system state will be displayed to him at all times and any terminal operation will prompt a confirmation dialog that describes the consequences of the action.

### **3. Design Constraints**

The system is constrained to use Java 8 as implementation language. The software development process will be the Rational Unified Process (RUP), tailored to fit the team and the project. The conceptual architecture of the system will be a client server as illustrated in Figure 2 Conceptual Architecture. The required development tools are either Eclipse IDE or IntelliJ IDEA. In terms of libraries we will use: JavaFX, Hibernate, JDBC and GSON.
